# Προβιοτικά = προς + βίος (για τη ζωή)

FAO/WHO 2001

Προβιοτικά είναι «*οι ζωντανοί οργανισμοί (βακτήρια και ζύμες) που όταν καταναλωθούν σε κατάλληλες ποσότητες ασκούν ευεργετική δράση στον ξενιστή*»

Ικανοποιητικός αριθμός:  $10^8$ - $10^9$  (cfu/g) την ημέρα (Speck, 1978)

Δηλαδή:  $10^6$  cfu/g σε ζυμούμενο γάλα  $\times 100g$  (ημερήσια κατανάλωση)  
 $10^7$  cfu/g σε τυρί  $\times 10g$  (ημερήσια κατανάλωση)

# Κυριότερα είδη προβιοτικών μικροοργανισμών

## ΒΑΚΤΗΡΙΑ

Lactobacillus

*L. acidophilus, L. casei, L. johnsonii, Lb. delbrueckii* subsp. *bulgaricus*, *L. helveticus*, *L. paracasei* subsp. *paracasei*, *L. gasseri*, *L. plantarum*, *L. rhamnosus*, *L. curvatus*, *L. brevis*, *L. fermentum*, *L. reuteri*, *L. cellobiosus*

Lactococcus

*Lc. lactis* subsp. *lactis*, *Lc. lactis* subsp. *cremoris*

Streptococcus

*Str. thermophilus*

Enterococcus

*Ent. faecium*, *Ent. faecalis*

Pediococcus

*P. acidilactici*

Bifidobacterium

*B. bifidum*, *B. infantis*, *B. longum*, *B. breve*, *B. adolescentis*

Propionibacterium

*Pr. freudenreichii*

## ΖΥΜΕΣ

Saccharomyces

*S. cerevisiae*, *S. boulardii*

# Κριτήρια επιλογής προβιοτικών μικροοργανισμών (FAO/WHO 2002)

- ✓ Να έχει γίνει η ταυτοποίησή τους σε επίπεδο είδους (ή ακόμη και στελέχους)
- ✓ Να είναι ασφαλή για χρήση σε τρόφιμα και φαρμακευτικά σκευασμάτα (έλεγχος αιμολυτικής και τοξικής δράσης, επιδημιολογικές μελέτες)
- ✓ Να επιβιώνουν και να διατηρούν τις ιδιότητές τους στο γαστρεντερικό σωλήνα (ανθεκτικότητα στο γαστρικό οξύ-χαμηλό pH και στα χολικά άλατα)
- ✓ Να έχουν ικανότητα προσκόλλησης ή και πολλαπλασιασμού σε επιφάνειες βλεννογόνου και ιδιαίτερα στον εντερικό βλεννογόνο.
- ✓ Να παρεμποδίζουν ή να μειώνουν την προσκόλληση παθογόνων μικροβίων στον εντερικό βλεννογόνο (ανταγωνιστική ή αντιμικροβιακή δράση)
- ✓ Να παρουσιάζουν ανοσοτροποποιητική δράση
- ✓ Να είναι ανθεκτικά σε σπερμοκτόνες ουσίες (εφόσον προορίζεται για κολπική χρήση)
- ✓ Να παρουσιάζουν καλές τεχνολογικές ιδιότητες εφόσον χρησιμοποιηθούν σε λειτουργικά τρόφιμα (σταθερότητα, να έχουν μεγάλη διάρκεια ζωής, να πολλαπλασιάζονται σε μεγάλη κλίμακα, να μην έχουν επίδραση στη γεύση του προϊόντος).

ORIGINAL ARTICLE

# Characterization of *Lactobacillus* isolates from infant faeces as dietary adjuncts

V. Xanthopoulos, E. Litopoulou-Tzanetaki\* and N. Tzanetakis

*Lactobacillus paracasei subsp. paracasei (six strains), Lb. rhamnosus (six strains), Lb. acidophilus (two strains), Lb. gasseri (three strains) and Lb. reuteri (three strains) isolates from new-born infants were tested for their ability to grow and metabolize in milk and to resist specific conditions of the gastrointestinal tract. Many of the tested strains had desirable properties concerning their ability to withstand adverse conditions of the gastrointestinal tract, and produce carbonyl compounds. In general, strains of Lb. paracasei subsp. paracasei and Lb. rhamnosus were more resistant to low pH of the stomach than all the other strains. On the other hand, Lb. gasseri and Lb. reuteri strains did not acidify milk. Thus, Lb. paracasei subsp. paracasei, Lb. acidophilus and Lb. rhamnosus strains could be preferably used as starters to produce fermented milks with possibly interesting organoleptic properties, as well as dietary and possible therapeutic importance.*

### Abstract

Yeast isolates from infant faeces and Feta cheese were characterized to species level by phenotypic criteria, Randomly Amplified Polymorphic DNA (RAPD)-PCR and mitochondrial DNA (mt-DNA) restriction analysis. Results suggested that there is a good agreement between phenotypic characterization of yeasts and RAPD-PCR at species level; in addition, RAPD-PCR as well as mt-DNA restriction analysis provided good discrimination at strain level. Some technological and probiotic properties of selected strains were also investigated. The test strains exhibited lipolytic and proteolytic activities. They also tolerated low pH and survived satisfactorily in gastric juice *in vitro* as well as in the presence of bile. In general, the isolates from faeces were more resistant to low pH and bile than those from Feta cheese. Selected strains could be used as starter supplements for industrial fermentations. © 2001 Elsevier Science B.V. All rights reserved.

# Characterization of lactic acid bacteria isolated from a Greek dry-fermented sausage in respect of their technological and probiotic properties

E. Papamanoli, N. Tzanetakis, E. Litopoulou-Tzanetaki, P. Kotzekidou\*

Laboratory of Food Microbiology and Hygiene, Department of Food Science and Technology, Faculty of Agriculture,

Received 15 April 2002; received in revised form 29 October 2002; accepted 29 October 2002

## Abstract

A total of 147 lactic acid bacteria was isolated from two types of naturally fermented dry sausages at four different stages of the ripening process studied in order to select the most suitable strains according to their technological characteristics including probiotic properties and antimicrobial activity against food-borne pathogens. Identification of the isolates revealed that 90% were lactobacilli, 4% enterococci, 3% *Pediococcus* sp. and sporadic isolates of *Weissella viridescens*, *Leuconostoc pseudomesenteroides*, and *Leuconostoc* sp. The isolated strains of *Lactobacillus sakei* (49 isolates), *Lactobacillus curvatus* (24 isolates) and *Lactobacillus plantarum* (7 isolates) were further characterized. All strains could grow at 15 °C, whereas the majority of the strains was able to grow in the presence of 6.5% NaCl and on acetate agar. The enzymatic potential of the strains was evaluated using the API ZYM system. During in vitro investigations all strains exhibited high leucine and valine aminopeptidase activities and moderate acid phosphatase and phosphohydrolase activities. Some strains showed very weak lipolytic activity. The enzyme profiling is an important factor for selection of strains as starter cultures. A large majority of the strains tolerated 0.1% bile salts whereas 58% of *Lactobacillus curvatus* strains and all *Lactobacillus plantarum* strains were resistant to 0.3% bile salts. All *Lactobacillus sakei* strains and the majority of *Lactobacillus curvatus* and *Lactobacillus plantarum* strains exhibited an anti-listerial activity against three *Listeria monocytogenes* strains. A percentage of 75, 50 and 29% of *Lactobacillus sakei*, *L. curvatus* and *L. plantarum* strains, respectively, could inhibit two *Staphylococcus aureus* strains. The contribution of the selected strains to a possible inhibition of *Listeria monocytogenes* and *S. aureus* in situ on fermented meats would be of considerable interest to enhance the hygienic quality of these products.

# Probiotic and Technological Properties of Facultatively Heterofermentative Lactobacilli from Greek Traditional Cheeses

George Floros, Magdalini Hatzikamari,  
Evanthia Litopoulou-Tzanetaki, and Nikolaos Tzanetakis

---

Laboratory of Food Microbiology and Hygiene, Aristotle University of Thessaloniki,  
Greece

Nineteen isolates of facultatively heterofermentative lactobacilli from Feta, Graviera, and Kasseri cheeses were identified by SDS-PAGE of whole-cell proteins as *L. paracasei* subsp. *paracasei* (12 strains) and *L. plantarum* (7 strains) and differentiated at strain level by RAPD-PCR. Properties of technological interest, such as acidification ability, proteolytic activity, and enzyme activities, were also studied. The test strains exhibited a low acidification activity, with significant interstrain differences after growth in milk for 24 h. They were also characterized by different casein breakdown ability, with around 50% of them accumulating amino acids at low amounts in the milk. Lactobacilli isolates differed in respect of enzyme activities, with  $\beta$ -galactosidase being the strongest activity found. Their probiotic potential was evaluated with *in vitro* studies on the resistance to low pH, bile salts, and pancreatin. The isolates from Feta showed a better survival than those from Kasseri and Graviera at low pH and viable cells were detected even after 3 h at pH 2.0. All strains tolerated bile salts at 0.3% and retained viability in the presence of pancreatin at 0.1%. Different patterns of antibacterial activities were recorded. The strains inhibited preferentially LAB species and some of them clostridia, *E. coli* O44 and *B. cereus*. Distinguished strains are promising probiotic candidates as adjuncts and deserve further studies.

# Selection of Dominant NSLAB from a Mature Traditional Cheese According to their Technological Properties and *in vitro* Intestinal Challenges

Zacharias Papanikolaou, Magdalini Hatzikamari, Panayiotis Georgakopoulos, Minas Yiagou, Evangelia Litopoulou-Tzanetaki, and Nikolaos Tzanetakis

---

**Abstract:** Isolates (47) of lactobacilli from 5 different productions of Melichloro cheese were examined for potential use as adjunct cultures. The sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) of whole-cell proteins classified 29 isolates as *L. paraplantarum* and 18 as *L. paracasei* subsp. *paracasei*. Randomly amplified polymorphic DNA-polymerase chain reaction (RAPD-PCR) analysis differentiated the *L. paraplantarum* and *L. paracasei* subsp. *paracasei* isolates at strain level and both, RAPD analysis and whole-cell protein profiling provided useful information about the diversity of nonstarter lactic acid bacteria (NSLAB) in the different cheese productions. The isolates were slow acidifiers and about 70% of them degraded, preferentially  $\alpha_1$ -casein. The amounts of amino acids accumulated in the milk increased with the incubation time. A similar enzyme profile was exhibited by strains of both species, except for  $\alpha$ -mannosidase and  $\alpha$ -fucosidase, which were not detected in the *L. paracasei* subsp. *paracasei* strains. All strains grew in the presence of bile at 0.3% and the majority was able to withstand pH 2.5 and pancreatin at 0.1%. Moreover, all strains reduced cholesterol *in vitro*, with higher removal ability recorded for strains of *L. paraplantarum*. A narrow spectrum of antibacterial activity was recorded for 88% of the strains. Selected isolates with appropriate technological and interesting *in vitro* intestinal challenges could be used as adjuncts and deserve further studies.
